

An introduction to Machine Learning

From Mike Handley CEO PolyChord Ltd

10th Cleanpower Smart Grids 2019, 1-2 July Cambridge, UK www.cir-strategy.com/events

What is Machine Learning?

When a Machine - such as a computer - learns without human guidance.

Essentially - a machine builds its own mathematical model.

*Is Machine
Learning the same
as Artificial
Intelligence?*

ARTIFICIAL INTELLIGENCE

MACHINE LEARNING

dozens of
different ML
methods

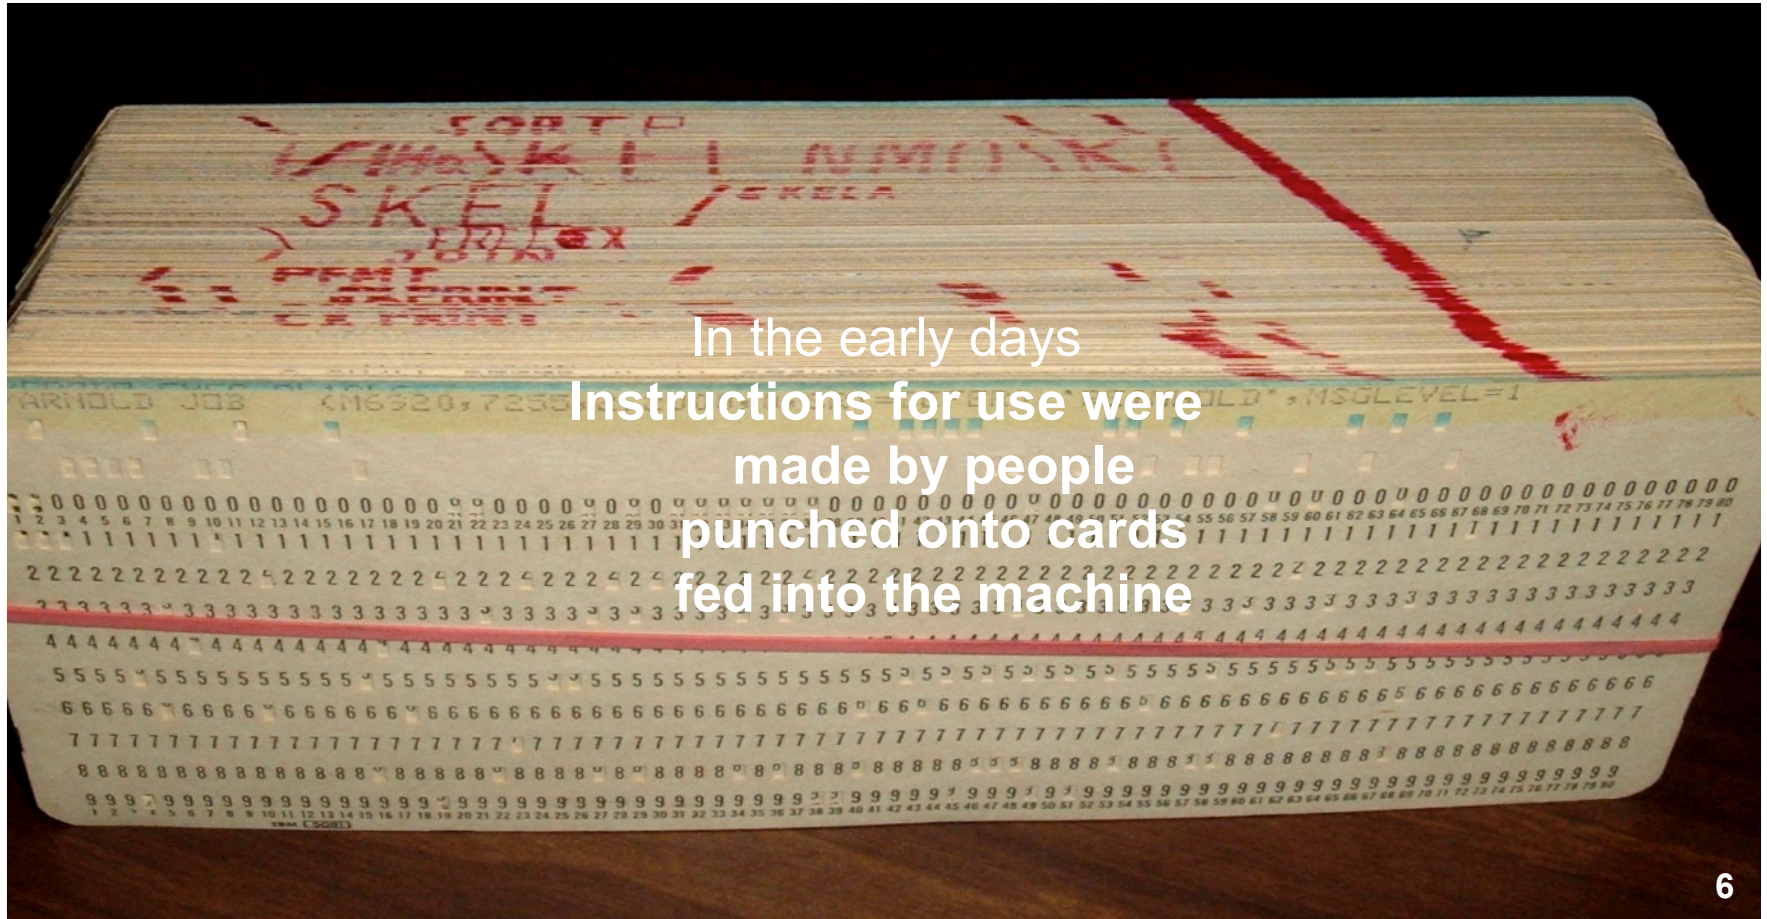

NEURAL NETS

DEEP
LEARNING

Consider the history

Think of the way computers
developed from the
beginning

In the early days
Instructions for use were
made by people
punched onto cards
fed into the machine

Lots of manual attention was required

The way people code now can be seen as
a natural evolution towards...

A Machine learning a set of instructions for itself

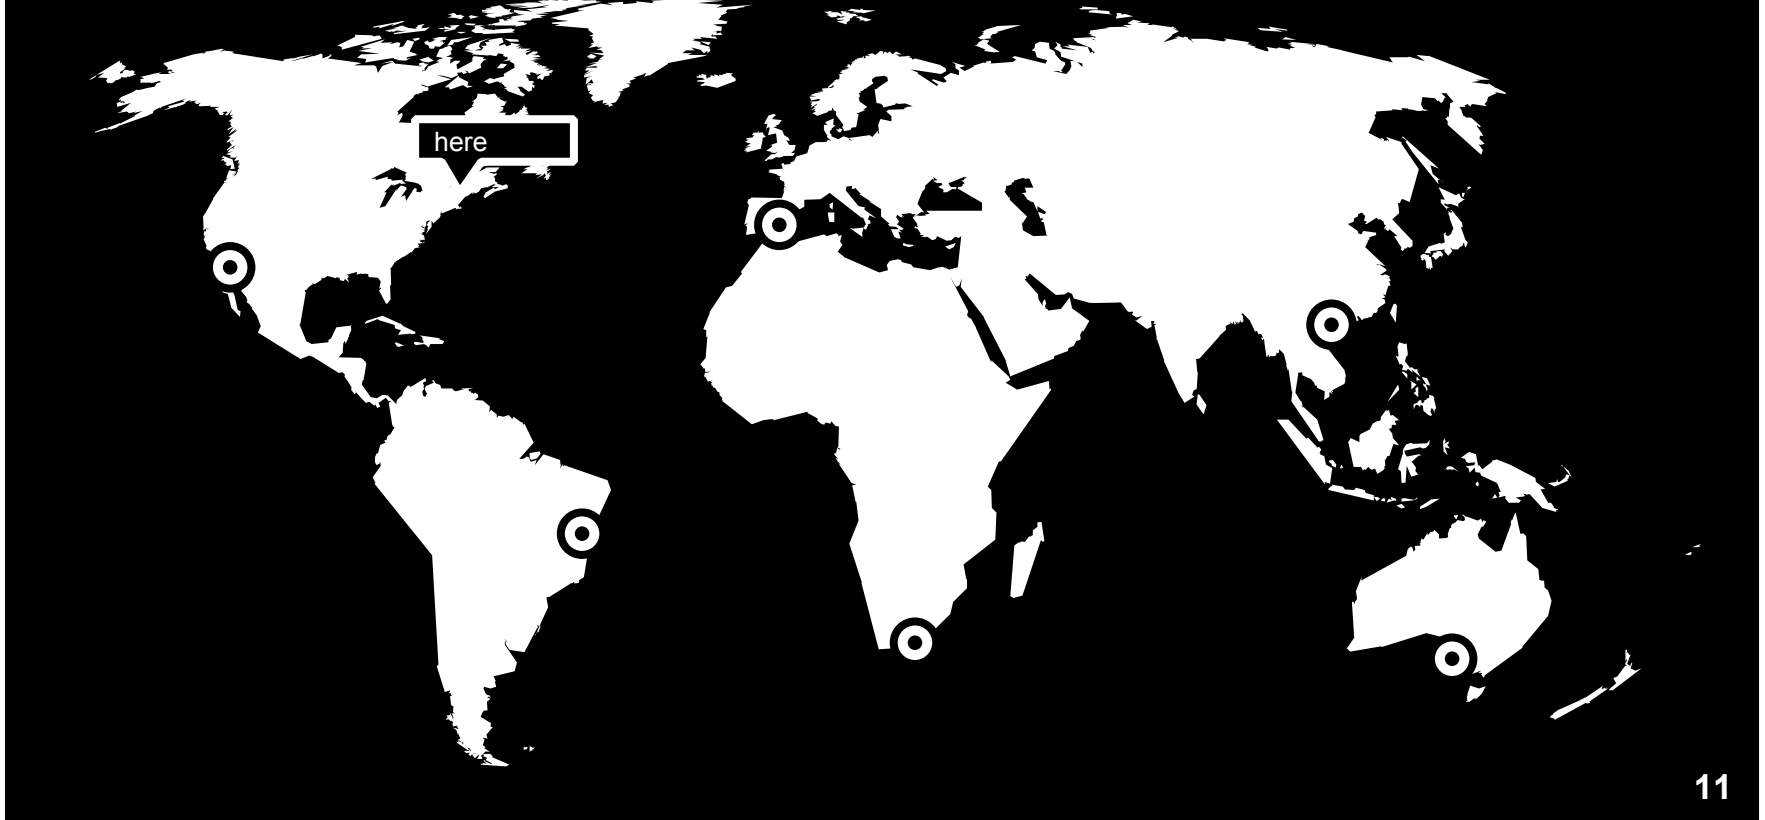

How could

A machine

Write instructions or learn
from data of its own accord?

Think of it as a mapping exercise

**...this kind of
mapping**

Let's choose a real example.

Suppose I know a set of faces...

And I want the machine to map them against another set of faces

**...I do this because I have
a purpose**

And “the set of arrows” between my data sets might look like this

**Remember the computer
assigns a numerical value
to each face**

And because it's a computer
those values are binary

**So think of this
as a fancy
calculator**

89,526,124

Because the computer thinks in numbers

It calculates this

It requires this answer

Does it match

a terrorist

face?

The neural network - as the name suggests - “sort of” mimics the human brain

We do this mapping ourselves. How many times have you thought: “I know that face from somewhere.....”

We can use Machine Learning techniques

- When you buy something: “You may also like this”
- Offer you a personalised energy tariff
- Suggest a route through a complex transport system
- Predict coastal erosion

Thanks!
